## Top 10 Reasons why Polar Seal Windows are better than the competition.

The beef is in a Polar Seal (right)

### 1. **Where's the beef? How 'bout more vinyl in your vinyl window?**

More walls and thicker walls means less chance for cold winter winds to seep in through your windows. More chambers help insulate; even as well as foam filled frames insulate...it's proven in test results!

No condensation on Polar Seal's no metal spacer (right)

### 2. **SuperSpacer<sup>®</sup>, the only TRUE WARM-EDGE<sup>™</sup>**

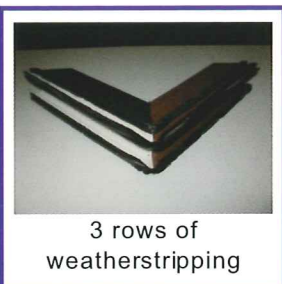

Silicone foam air spacer separates inner and outer pane of glass so cold can't transfer in quickly like metal spacers. Conducts 100 times less temperature than other "warm edge" steel spacers, reducing the chance of condensation, sweat or mold on your brand new windows.

Darker Low E's reduce FREE energy from the sun (Polar Seal on left)

### 3. **The #1 rated Low E glass in Canada is your best bet to save heating dollars**

As winter gas bills soar, using the right kind of Low E becomes even more important. Our "Hard Coat" Low E has the same net heat loss as an R-19 wall because it allows more FREE solar energy in than any other Low E or Heat Mirror available.

3 rows of weatherstripping

### 4. **Triple Ultrasonically welded weatherstripping**

50-100% more weatherstripping than others seals out wintery drafts better. Welded fibers remain longer than woven and pile directors keep those fibers standing up straight. Black weatherstripping lasts longer and looks better years down the road by hiding dirt.

No fading or sagging in Polar Seal's screen

**5. Aluminum screen wire lasts longer**

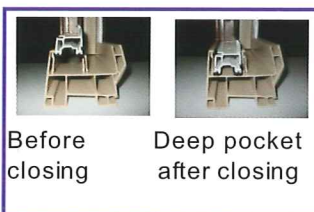

Sure, it's tougher to get aluminum wire screens installed in the home without denting them (that's why we package them separately), but once they are installed, they won't sag, fade and deteriorate like fiberglass screen wire.

Interlocking sashes keep air out better

**6. Interlocking sashes eliminate leaks**

We take the time and workmanship required to make a window with sashes that interlock. Polar Seal has engineered a window that keeps out the winter winds better than windows simply relying on butting the sashes together and hoping the weatherstrip will stop the air.

Before closing      Deep pocket after closing

**7. Deep pocket sills and jambs cut wind down**

90 Degree angles make it tougher for air to penetrate.. However, most forget this feature at the sill. By sinking the sashes into deep pocketing jambs and sills, air's chances of getting in to your home are slim to none.

Have you seen more choice in a vinyl window?

**8. 78 different color and wood combinations**

Choose from 3 main colors (white, tan or earthtone), add 4 real wood-look interior options (Light Oak, Dark Oak, Cherry or Paintable/Stainable Simulated Oak), and 7 exterior color options (white, tan, earthtone, green, clay, terratint, bronze and coming spring '04 gray!)

Double strength glass on left

**9. Double strength glass looks and performs better**

Thicker glass resists breakage better and lays flatter than single strength, reducing awkward concave reflections. Go ahead, knock on our glass and compare it to the others.

Service after the sale

**10. Unmatched service: Lifetime Limited Warranty**

No other vinyl window manufacturer that we know of stipulates in their warranty that they, the factory, will make house calls to service their products. Our warranty is worth much more than the paper it's printed on; it is a contract between Polar Seal and the homeowner.
